

Plant Fact Sheet

SHORTBEARD PLUMEGRASS *Saccharum bervibarbe* (Michx.) Pers. var. *contortum* (Ell.) R. Webster Plant Symbol = SABRC3

Contributed By: USDA NRCS National Plant Data Center

From Britton & Brown (1913)
@ plants.usda.gov

Alternate Name

Erianthus contortus, bent-awn plumegrass

Uses

Cattle and horses graze this grass.

Status

Please consult the PLANTS Web site and your State Department of Natural Resources for this plant's

current status, such as, state noxious status and wetland indicator values.

Description

Grass Family (Poaceae). This plumegrass is a native, warm-season, robust, perennial bunch grass. The average height is 4 to 7 feet. The leaf blade is wide and flat with strong midrib. The leaf sheath has few hairs, especially at upper end, and is shorter than internodes. The stem is large and rigid and 3/8 to 1/2 inches in diameter at base. The nodes are smooth or covered with short white hairs. Seedheads are open panicles, brownish at maturity with hairs as long as spikelets at its base. The glume has an awn 3/8 to 1/2 inched long spirally coiled at the base of the spikelet.

Management

This grass is easily overgrazed. A season-long grazing deferment every 2 to 3 years maintains healthy, vigorous plants.

Establishment

New growth comes from axillary buds at the basal nodes each year about April or May. It also reproduces from seed. It grows in large bunches 8 to 10 inches in diameter and the seedheads appear in September and October. It grows mostly on moist sandy to sandy loam soils high in natural fertility.

Cultivars, Improved and Selected Materials (and area of origin)

Please contact your local NRCS Field Office.
